- **Tahir Shafiq – PES2UG23CS639**

Course: Database Management Systems – UE23CS351A

Guided By: Gamini Joshi

Institution: PES University

Short Abstract

This project presents a **database-driven Expense Tracker system** designed to manage users' financial activities such as incomes, expenses, budgets, and saving goals. The backend is built using **MySQL**, with well-structured tables, integrity constraints, foreign keys with cascading deletes, and business rules implemented through **triggers, stored procedures, and SQL functions**. The system includes validation triggers for transaction–category consistency, a goal-updating trigger that automatically applies income to active goals, and a stored procedure for securely adding new transactions. A balance-calculation function is also implemented to compute a user's net financial position.

A lightweight web interface is developed using **Flask (Python)** to interact with the database. The app allows users to add transactions via the stored procedure, view all tables, and demonstrate cascading deletes when a user is removed. The project integrates core DBMS concepts including ER-to-relational mapping, DDL and DML operations, constraints, joins, aggregates, triggers, functions, and procedures. Overall, the system illustrates how database logic and application logic work together to maintain data accuracy, enforce rules, and support real-world financial tracking in an efficient and consistent manner.

User Requirement Specification (URS)

1. Introduction

The Expense Tracker web application allows users to view database tables, add transactions through a stored procedure, and delete users with cascading effects. The system acts as a front-end interface for interacting with a MySQL database containing users, transactions, budgets, and goals.

2. Purpose

The purpose of this application is to provide a simple web interface that demonstrates:

- Calling MySQL stored procedures
- Executing triggers (indirectly through DB operations)
- Performing cascading deletes
- Viewing data from different tables

The system is a demo to showcase DBMS concepts using a minimal Flask front-end.

3. Scope

The application supports only the following operations

- Add a transaction using a stored procedure `sp_add_transaction`
 - Display tables: users, transactions, goals, budgets
 - Delete a user (which triggers ON DELETE CASCADE in MySQL)
 - Simple UI using HTML forms to perform these actions
-

4. System Overview

The system consists of:

- A Flask web server (app.py)
- MySQL database connection using mysql.connector
- Inline HTML templates rendered using render_template_string

It has three primary routes:

- GET / → View tables
 - POST /add_transaction → Add transaction (calls stored procedure)
 - POST /delete_user/<id> → Delete user
-

5. Functional Requirements

5.1 View Data Requirements

Requirement ID	Description
FR-01	The system must allow users to view selected database tables: transactions, goals, budgets, users.
FR-02	On page load, the system must display <i>transactions</i> and <i>users</i> by default.
FR-03	Users must be able to select which tables to show using checkboxes.

5.2 Add Transaction Requirements

Requirement ID	Description
FR-04	The system must provide a form to add a transaction (user_id, category_id, amount, type, date).

Requirement ID	Description
FR-05	The system must call the stored procedure sp_add_transaction when a transaction is submitted.
FR-06	The system must commit the transaction to the database and display a flash message.
FR-07	The system must retrieve and display the last inserted transaction ID returned by the procedure.

5.3 Delete User Requirements

Requirement ID	Description
FR-08	The system must allow deleting users through a delete button.
FR-09	The system must call DELETE FROM users WHERE user_id = ?.
FR-10	The system must rely on MySQL's ON DELETE CASCADE to delete related data (transactions, goals, budgets).
FR-11	The system must show a success or error flash message after deletion.

5.4 Error Handling Requirements

Requirement ID	Description
FR-12	The system must catch MySQL errors and show them using flash messages.
FR-13	The system must close database connections after each operation (try-finally).

5.5 UI Requirements

Requirement ID	Description
FR-14	The system must use a simple HTML interface embedded inside Python as a string.
FR-15	The UI must display tables in HTML <table> format with headings.
FR-16	The UI must provide a form with text inputs and dropdown for adding transactions.
FR-17	The system must show flash messages at the bottom of the page.

6. Non-Functional Requirements

NFR ID Requirement

NFR-01 The system must connect to MySQL using credentials provided in code.

NFR-02 The system must follow a synchronous request-response model.

NFR-03 The interface must load within a browser without additional CSS/JS frameworks.

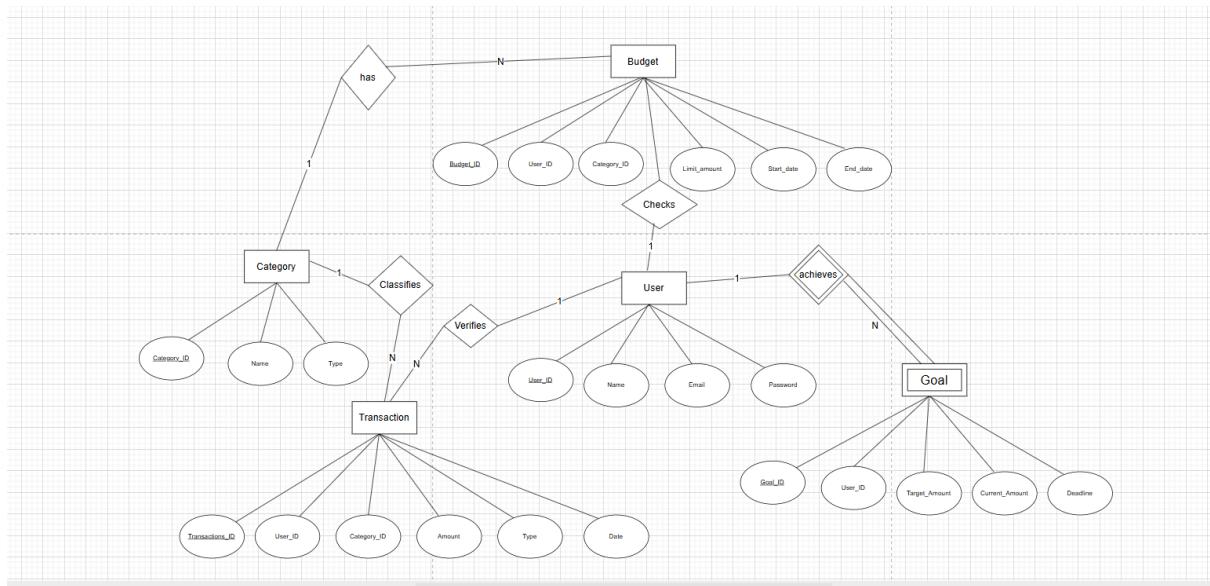

NFR-04 The system must run locally using Flask's development server.

List of Software / Tools / Programming Languages Used

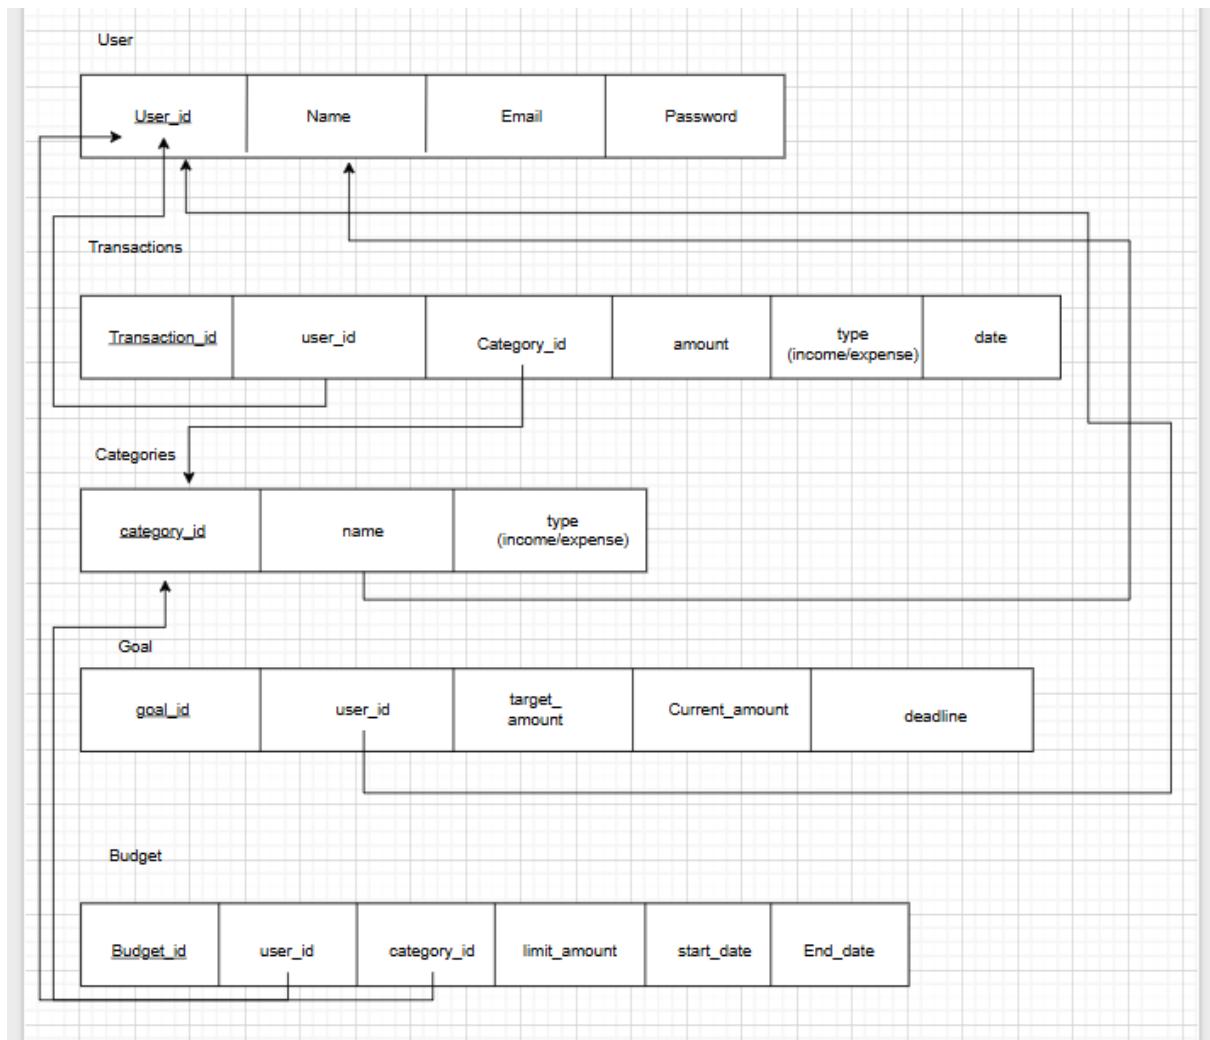

- **Python 3.x** – For backend logic and web server
- **Flask Framework** – To create the web application and routes
- **MySQL Database** – To store all user, transaction, goal, and budget data
- **mysql-connector-python** – Python library for connecting Flask with MySQL

- **HTML & CSS (inline)** – For the simple user interface rendered using Flask
- **MySQL Workbench / Command Line** – For executing SQL queries, procedures, and triggers
- **Browser (Chrome/Firefox)** – To run and view the web interface

Relational Schema:

DDL Commands

```
CREATE DATABASE expense_tracker;
```

```
USE expense_tracker;
```

```
CREATE TABLE users (
    user_id INT AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(100) NOT NULL,
    email VARCHAR(255) NOT NULL UNIQUE,
    password VARCHAR(255) NOT NULL
);
```

```
CREATE TABLE categories (
    category_id INT AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(100) NOT NULL,
    type ENUM('income','expense') NOT NULL
);
```

```
CREATE TABLE transactions (
    transaction_id INT AUTO_INCREMENT PRIMARY KEY,
    user_id INT NOT NULL,
    category_id INT NOT NULL,
    amount DECIMAL(12,2) NOT NULL CHECK (amount > 0),
    type ENUM('income','expense') NOT NULL,
    date DATE NOT NULL,
    FOREIGN KEY (user_id) REFERENCES users(user_id) ON DELETE CASCADE,
    FOREIGN KEY (category_id) REFERENCES categories(category_id)
);
```

```
DELIMITER $$
```

```
CREATE TRIGGER check_transaction_type
BEFORE INSERT ON transactions
FOR EACH ROW
BEGIN
DECLARE cat_type ENUM('income','expense');
SELECT type INTO cat_type FROM categories WHERE category_id = NEW.category_id;
IF cat_type <> NEW.type THEN
    SIGNAL SQLSTATE '45000'
    SET MESSAGE_TEXT = 'Transaction type does not match category type';
END IF;
END$$
```

```
DELIMITER ;
```

```

List of functionalities/features of the application

1. Home page — Default view (Transactions + Users)

- Feature: Display transactions and users by default.
- Action: Open <http://localhost:5000> (no query parameters).

The screenshot shows the 'Expense Tracker — DB Demo' application interface. At the top, there's a message: 'Features: Stored procedures, triggers (type validation & auto-goal updates), and CASCADE delete demonstration.' Below it, a green bar indicates 'User "James Dorman" (ID: 4) added successfully!'. The main area has several sections:

- Add User:** A form with fields for Name (e.g., John Doe), Email (e.g., john@example.com), and Password (Leave password). A green 'Add User' button is present.
- Add Transaction (Stored Procedure):** A form with dropdowns for User (Selected User), Category (Select Category), Amount (e.g., 1500.00), Type (Expense), and Date (dd-mm-yyyy). A green 'Add Transaction' button is present.
- View Data:** A section with checkboxes to toggle visibility for Transactions, Goals (with auto-update), Budgets, Users, and Categories. A green 'Refresh View' button is present.
- Transactions:** A table showing transaction details with columns: ID, User ID, Category ID, Amount, Type, and Date. The data includes various entries like income and expense transactions from different users and dates.
- Goals (Automatically Updated by Income Trigger):** A table showing goals with columns: ID, User ID, Target, Current, Progress, and Deadline. Two goals are listed for users 1 and 2.
- Users (Delete to Demonstrate CASCADE):** A table showing users with columns: ID, Name, Email, Balance, and Action. Three users are listed: Alice Kumar, Bob Singh, and James Dorman. A note above the table states: 'Deleting a user will CASCADE delete all their transactions, goals, and budgets.'

- Why: Proves basic UI rendering and default tables loaded from DB.

2. Toggle displayed tables (show Goals & Budgets)

- Feature: Choose which tables to display via checkboxes.
- Action: On the “List Data” form, check Goals and Budgets, uncheck Transactions if desired, click Refresh.

View Data

<input type="checkbox"/>	Transactions	<input checked="" type="checkbox"/>	Goals (with auto-update)	<input type="checkbox"/>	Budgets	<input type="checkbox"/>	Users	<input type="checkbox"/>	Categories	<input type="checkbox"/>
<button>Refresh View</button>										

Goals (Automatically Updated by Income Trigger)

ID	User ID	Target	Current	Progress	Deadline
1	1	₹20000.00	₹10000.00	50.0%	2026-06-30
2	2	₹50000.00	₹25000.00	50.0%	2026-12-31

View Data

<input type="checkbox"/>	Transactions	<input type="checkbox"/>	Goals (with auto-update)	<input type="checkbox"/>	Budgets	<input checked="" type="checkbox"/>	Users	<input type="checkbox"/>	Categories	<input type="checkbox"/>
<button>Refresh View</button>										

Budgets

ID	User ID	Category ID	Limit	Start Date	End Date
1	1	3	₹6000.00	2025-08-01	2025-08-31
2	2	5	₹2000.00	2025-08-01	2025-08-31

- **Why:** Demonstrates that the UI can filter which tables are fetched/displayed.

3. Add Transaction — Form filled (before submit)

- **Feature:** Add a transaction using the stored procedure (`sp_add_transaction`).
- **Action:** In “Add Transaction” form fill:
 - **user_id:** (e.g., 1)
 - **category_id:** (e.g., choose 1 for Salary or an expense category as appropriate)
 - **amount:** 1500
 - **type:** income or expense (choose to match category)
 - **date:** YYYY-MM-DD (e.g., 2025-11-18)
 - **Click Add Transaction.**
- **Screenshot to take (form filled):**

Add Transaction (Stored Procedure)

The screenshot shows a form titled "Add Transaction (Stored Procedure)". It has five input fields: "User" (dropdown menu showing "James Dorman (ID: 3)"), "Category" (dropdown menu showing "Rent (expense)"), "Amount" (text input field showing "1200"), "Type" (dropdown menu showing "Expense"), and "Date" (text input field showing "18 - 11 - 2025"). Below the form is a green button labeled "Add Transaction".

- **Why:** Shows the input that will call the stored procedure and the UI fields available.

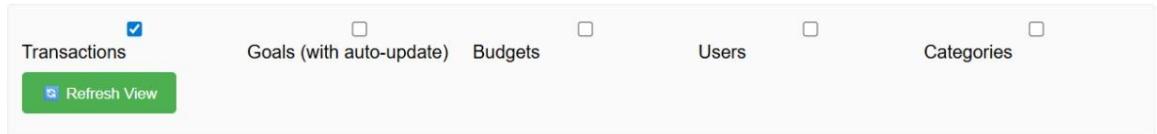

4. Add Transaction — Success flash message (after submit)

- **Feature:** Stored procedure is called; the app commits and flashes a message with returned id (if procedure SELECTs LAST_INSERT_ID()).
- **Action:** Submit the form from step 3.
- **Screenshot to take:**
 - **Filename:** 04_add_transaction_success.png
 - **Caption:** *Flash message confirming transaction added and showing returned transaction id.*
- **Why:** Proves stored procedure invocation and that application reads stored_results().

5. Transactions table — showing newly inserted row

- **Feature:** Transactions table updated with newly added transaction.
- **Action:** Make sure the Transactions checkbox is selected and Refresh (or revisit /). Locate inserted row.
- **Screenshot to take:**

 View Data

Transactions

ID	User ID	Category ID	Amount	Type	Date
11	2	1	₹1000.00	income	2025-11-18
12	1	1	₹1000.00	income	2025-11-18
13	1	4	₹50000.00	expense	2025-11-18
7	1	1	₹4000.00	income	2025-10-31
8	2	1	₹10000.00	income	2025-10-31
9	2	1	₹1000.00	income	2025-10-31
10	2	1	₹1000.00	income	2025-10-30
5	1	5	₹500.00	expense	2025-08-15
4	2	2	₹2000.00	income	2025-08-10
3	2	4	₹8000.00	expense	2025-08-05
2	1	3	₹1500.00	expense	2025-08-03
1	1	1	₹50000.00	income	2025-08-01

- Why: Proof of successful insertion + data visible via the UI.

6. Goals table — AFTER adding income (trigger effect)

- Feature: Trigger `apply_income_to_goal_after_insert` updates `goals.current_amount`.
 - Action: Refresh the Goals table in the UI (select Goals and Refresh).
 - Screenshot to take:
 - Filename: `07_goals_after_income.png`
 - Caption: *Goals table after adding the income transaction — current_amount increased (trigger applied).*
 - Why: Demonstrates the database trigger automatically updated goal progress — a key DBMS feature.

7. Users table — BEFORE Deleting a User

- Feature: Show users list to choose which user to delete.
 - Action: Ensure Users is selected and Refresh. Capture the Users table before deletion.

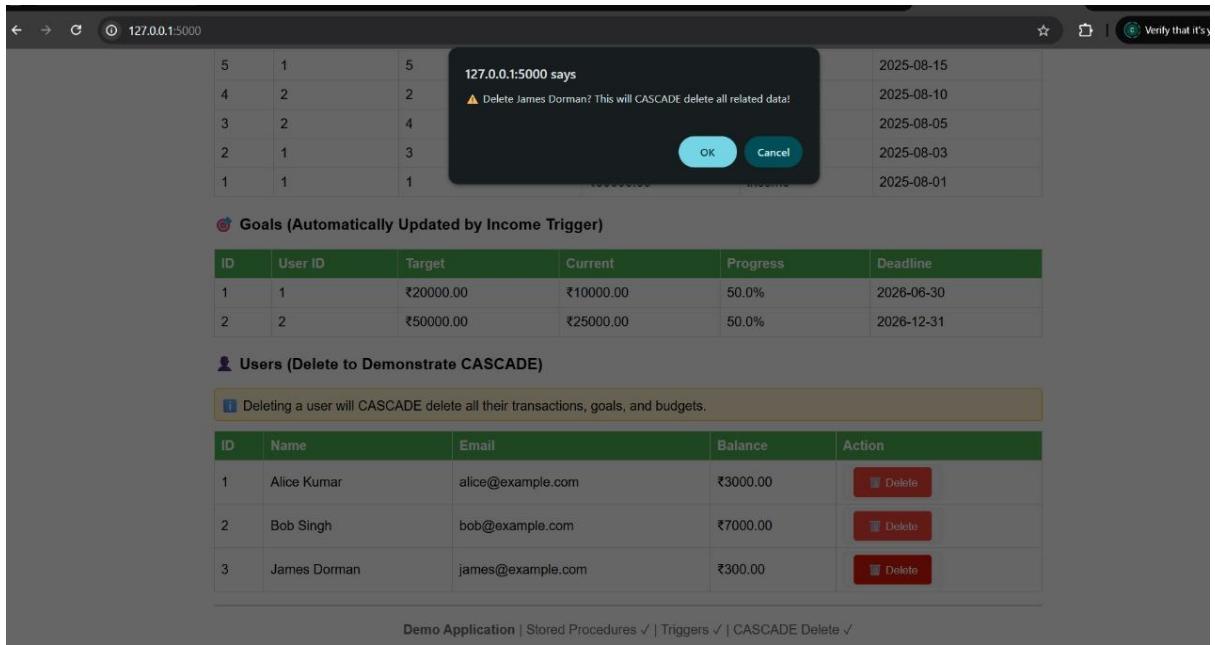

Users (Delete to Demonstrate CASCADE)

Deleting a user will CASCADE delete all their transactions, goals, and budgets.				
ID	Name	Email	Balance	Action
1	Alice Kumar	alice@example.com	₹3000.00	 Delete
2	Bob Singh	bob@example.com	₹7000.00	 Delete
4	James Dorman	james@example.com	₹0.00	 Delete

- Why: Baseline before delete for cascade demonstration.

8. Delete User — Confirmation (use the delete button in the Users table)

- Feature: Delete a user via the delete button in the Users table.
- Action: Click Delete on a user row; browser confirm box will appear (click OK).
- Screenshot to take:

The screenshot shows a web application interface with three main sections: a transaction table, a goal table, and a user table.

- Transactions Table:** A grid of numbers (5, 1, 5; 4, 2, 2; 3, 2, 4; 2, 1, 3; 1, 1, 1) with a timestamp column (2025-08-15 to 2025-08-01).
- Goals Table:** A table with columns ID, User ID, Target, Current, Progress, and Deadline. It contains two rows: (1, 1, ₹20000.00, ₹10000.00, 50.0%, 2026-06-30) and (2, 2, ₹50000.00, ₹25000.00, 50.0%, 2026-12-31).
- Users Table:** A table with columns ID, Name, Email, Balance, and Action. It contains three rows: (1, Alice Kumar, alice@example.com, ₹3000.00,  Delete), (2, Bob Singh, bob@example.com, ₹7000.00,  Delete), and (4, James Dorman, james@example.com, ₹0.00,  Delete).

A modal dialog box is centered over the users table, displaying the message: "127.0.0.1:5000 says" and "⚠ Delete James Dorman? This will CASCADE delete all related data!". It has "OK" and "Cancel" buttons.

At the bottom of the page, a footer bar displays: "Demo Application | Stored Procedures ✓ | Triggers ✓ | CASCADE Delete ✓".

- Why: Shows the UI action that triggers the cascade delete.
-

Triggers, Procedures/Functions, Nested query, Join, Aggregate queries

1. Triggers (SQL + explanation)

1.1 check_transaction_type_before_insert — validate category type before inserting

DELIMITER \$\$

CREATE TRIGGER check_transaction_type_before_insert

BEFORE INSERT ON transactions

FOR EACH ROW

BEGIN

DECLARE cat_type ENUM('income','expense');

SELECT type INTO cat_type FROM categories WHERE category_id = NEW.category_id;

IF cat_type <> NEW.type THEN

SIGNAL SQLSTATE '45000' SET MESSAGE_TEXT = 'Transaction type does not match category type';

END IF;

END\$\$

DELIMITER ;

What it does: prevents inserting a transaction whose type (income/expense) does not match the type of the chosen category.

Why useful: enforces data integrity at the DB level so the application cannot create inconsistent rows.

1.2 check_transaction_type_before_update — validate on update

DELIMITER \$\$

CREATE TRIGGER check_transaction_type_before_update

BEFORE UPDATE ON transactions

FOR EACH ROW

BEGIN

DECLARE cat_type ENUM('income','expense');

IF NEW.category_id IS NOT NULL THEN

```

SELECT type INTO cat_type FROM categories WHERE category_id = NEW.category_id;
IF cat_type <> NEW.type THEN
    SIGNAL SQLSTATE '45000' SET MESSAGE_TEXT = 'Updated transaction type does not
match updated category type';
END IF;
END IF;
END$$

DELIMITER ;

```

What it does: same validation but for updates to transactions.

Why useful: avoids inconsistent state if transaction fields change later.

1.3 apply_income_to_goal_after_insert — update goals when income is added

```

DELIMITER $$

CREATE TRIGGER apply_income_to_goal_after_insert
AFTER INSERT ON transactions
FOR EACH ROW
BEGIN
DECLARE v_goal_id INT;
IF NEW.type = 'income' THEN
    SELECT goal_id INTO v_goal_id
    FROM goals
    WHERE user_id = NEW.user_id
        AND current_amount < target_amount
        AND (deadline IS NULL OR deadline >= NEW.date)
    ORDER BY deadline IS NULL, deadline ASC
    LIMIT 1;
    IF v_goal_id IS NOT NULL THEN
        UPDATE goals
        SET current_amount = LEAST(target_amount, current_amount + NEW.amount)
    END IF;
END IF;
END$$

DELIMITER ;

```

```
        WHERE goal_id = v_goal_id;  
    END IF;  
END IF;  
END$$
```

DELIMITER ;

What it does: after an income transaction is inserted, picks the earliest open goal for that user and adds the income amount to current_amount (but caps it at target_amount).

Why useful: automatic goal progress update demonstrates triggers automating business rules without app code changes.

2. Stored Procedure and Function (SQL + explanation)

2.1 sp_add_transaction — add transaction with validation & return id

DELIMITER \$\$

```
CREATE PROCEDURE sp_add_transaction(
```

```
    IN p_user_id INT,  
    IN p_category_id INT,  
    IN p_amount DECIMAL(12,2),  
    IN p_type VARCHAR(10),  
    IN p_date DATE
```

)

BEGIN

```
    IF p_amount <= 0 THEN  
        SIGNAL SQLSTATE '45000' SET MESSAGE_TEXT = 'Amount must be > 0';  
    END IF;
```

```
    INSERT INTO transactions (user_id, category_id, amount, type, date)
```

```
    VALUES (p_user_id, p_category_id, p_amount, p_type, p_date);
```

```
    SELECT LAST_INSERT_ID() AS transaction_id;
```

END\$\$

```
DELIMITER ;
```

What it does: centralizes transaction insertion, enforces amount > 0, inserts row, and returns the new transaction_id.

Why useful: app calls this single entry point (app.py uses cur.callproc('sp_add_transaction', ...)), ensuring validations and side-effects (triggers) occur consistently.

2.2 fn_get_user_balance — compute net balance (income - expense)

```
DELIMITER $$
```

```
CREATE FUNCTION fn_get_user_balance(p_user_id INT)
```

```
RETURNS DECIMAL(14,2)
```

```
DETERMINISTIC
```

```
BEGIN
```

```
    DECLARE v_income DECIMAL(14,2) DEFAULT 0.00;
```

```
    DECLARE v_expense DECIMAL(14,2) DEFAULT 0.00;
```

```
    SELECT IFNULL(SUM(amount),0.00) INTO v_income
```

```
    FROM transactions
```

```
    WHERE user_id = p_user_id AND type = 'income';
```

```
    SELECT IFNULL(SUM(amount),0.00) INTO v_expense
```

```
    FROM transactions
```

```
    WHERE user_id = p_user_id AND type = 'expense';
```

```
    RETURN v_income - v_expense;
```

```
END$$
```

```
DELIMITER ;
```

What it does: returns the user's current balance based on stored transactions.

Why useful: quick, reusable calculation inside SQL or from the Flask app.

3. Nested Queries (Subqueries) — examples & explanations

3.1 Users whose total expense > 10000 (subquery)

```
SELECT user_id  
FROM (  
    SELECT user_id, SUM(amount) AS total_expense  
    FROM transactions  
    WHERE type = 'expense'  
    GROUP BY user_id  
) t  
WHERE total_expense > 10000;
```

What it does: inner query computes total expense per user; outer query filters users exceeding threshold.

Why useful: find heavy spenders for reporting.

3.2 Users with their latest transaction date (correlated subquery)

```
SELECT u.user_id, u.name,  
    (SELECT MAX(t.date) FROM transactions t WHERE t.user_id = u.user_id) AS last_txn_date  
FROM users u;
```

What it does: for each user, picks the most recent transaction date via correlated subquery.

Why useful: shows user activity recency.

3.3 Goals close to deadline with remaining amount > X (nested + filter)

```
SELECT g.goal_id, g.user_id, g.target_amount, g.current_amount, g.deadline,  
    (g.target_amount - g.current_amount) AS remaining  
FROM goals g  
WHERE g.deadline IS NOT NULL  
    AND g.deadline <= DATE_ADD(CURDATE(), INTERVAL 30 DAY)  
    AND (g.target_amount - g.current_amount) > 0;
```

What it does: finds goals expiring in 30 days with remaining amount > 0.

Why useful: actionable reminders/alerts.

4. Joins — examples & explanations

4.1 Transactions with category name and user name

```
SELECT t.transaction_id, u.user_id, u.name AS user_name,
       c.category_id, c.name AS category_name,
       t.amount, t.type, t.date
  FROM transactions t
  JOIN users u ON t.user_id = u.user_id
  JOIN categories c ON t.category_id = c.category_id
 ORDER BY t.date DESC
LIMIT 200;
```

What it does: joins three tables to show human-friendly transaction rows.

Why useful: essential for UI listing (this is basically what app.py shows for transactions).

4.2 Budgets with category and user info

```
SELECT b.budget_id, u.name AS user_name, c.name AS category_name,
       b.limit_amount, b.start_date, b.end_date
  FROM budgets b
  JOIN users u ON b.user_id = u.user_id
  JOIN categories c ON b.category_id = c.category_id
 ORDER BY b.start_date DESC;
```

What it does: creates readable budget rows with user and category names.

Why useful: frontend display and reports.

5. Aggregate Queries — examples & explanations

5.1 Monthly total per category for a user

```
SELECT c.name AS category_name, c.type, SUM(t.amount) AS total_amount
  FROM transactions t
  JOIN categories c ON t.category_id = c.category_id
 WHERE t.user_id = 1 AND DATE_FORMAT(t.date, '%Y-%m') = '2025-08'
 GROUP BY c.category_id, c.name, c.type
 ORDER BY total_amount DESC;
```

What it does: sums amounts per category for a single user in a month.

Why useful: generate monthly expense/income breakdown.

5.2 Total income and total expense per user (one row per user)

```
SELECT u.user_id, u.name,  
       COALESCE(SUM(CASE WHEN t.type='income' THEN t.amount END),0) AS total_income,  
       COALESCE(SUM(CASE WHEN t.type='expense' THEN t.amount END),0) AS total_expense  
FROM users u  
LEFT JOIN transactions t ON u.user_id = t.user_id  
GROUP BY u.user_id, u.name;
```

What it does: aggregates income/expense per user in one query using conditional aggregation.

Why useful: quick summary of users' cashflow.

5.3 Top 3 expense categories across all users

```
SELECT c.name, SUM(t.amount) AS total_spent  
FROM transactions t  
JOIN categories c ON t.category_id = c.category_id  
WHERE t.type='expense'  
GROUP BY c.category_id, c.name  
ORDER BY total_spent DESC  
LIMIT 3;
```

What it does: finds categories where users spend most.

Why useful: analytics and insights.

6. How to call the stored procedure from Flask (your app does this already)

Your app.py uses this exact pattern:

```
conn = get_conn()  
cur = conn.cursor()  
cur.callproc('sp_add_transaction', (int(user_id), int(category_id), float(amount), typ, date))  
conn.commit()
```

```
# To read any result set the stored proc SELECTed:  
for res in cur.stored_results():  
    rows = res.fetchall()  
    if rows:  
        last_id = rows[0][0] if isinstance(rows[0], tuple) else rows[0]
```

Code snippets for invoking the Procedures/Functions/Trigger

1. Invoking Stored Procedure – sp_add_transaction

```
conn = get_conn()  
cur = conn.cursor()  
  
cur.callproc('sp_add_transaction', (  
    int(user_id),  
    int(category_id),  
    float(amount),  
    typ,  
    date  
))  
  
conn.commit()  
  
# Fetch the returned transaction_id  
for result in cur.stored_results():  
    last_id = result.fetchone()[0]
```

What this does:

Calls the stored procedure to insert a new transaction and retrieves the inserted ID.

2. Invoking SQL Function – fn_get_user_balance

```
conn = get_conn()  
cur = conn.cursor()  
  
cur.execute("SELECT fn_get_user_balance(%s)", (user_id,))  
balance = cur.fetchone()[0]  
  
What this does:  
Executes the SQL function and returns the user's balance directly from the database.
```

3. Trigger Invocation (Indirect)

Triggers run automatically; the app doesn't call them directly.
They fire when the app inserts transactions.

Example: Trigger runs after INSERT

```
conn = get_conn()
```

```
cur = conn.cursor()
```

```
# This INSERT triggers:
```

```
# - BEFORE triggers (validate category-type)
```

```
# - AFTER trigger (auto-update goals)
```

```
cur.callproc('sp_add_transaction', (
    user_id, category_id, amount, typ, date
))
```

```
conn.commit()
```

What this does:

The trigger such as apply_income_to_goal_after_insert executes automatically **after the stored procedure inserts a new transaction**.
